

Assignment: Books/Authors with Templates

Objectives:

- Practice incorporating a many-to-many relationship in a full-stack application

Using the same project from the previous assignment, create an application that does the following:

1. Add a template for creating books that also displays a table of all books in the database
2. Complete the route for adding a book to the database
3. Add a template that displays a specific book and its details, including all the authors associated with the given book
4. Create a form on the specific book template that has a dropdown of all the authors in the database. The "Add" button should add the selected author to the given book.

5. Add a template for creating authors that also displays a table of all authors in the database
6. Complete the route for adding an author to the database
7. Add a template that displays a specific author and its details, including all the books associated with the given author
8. Create a form on the specific author template that has a dropdown of all the books in the database. The "Add" button should add the selected book to the given author.
9. SENSEI BONUS: Have the dropdown menus only include authors or books not yet associated with the given book or author, respectively
